Java secure coding

3-day course

Course description

Secure programming is the best defense against hackers. This multilayered hands-on course will demonstrate live real time hacking methods , analyze the code deficiency that enabled the attack and most importantly, teach how to prevent such vulnerabilities by adopting secure coding best practices in order to bullet-proof your J2EE application.

The methodology of the Cycle of knowledge is as follows: Understand, Identify, Prevent. This methodology presents the student with analytical tools to keep a deeper understanding of coding vulnerabilities and implement security countermeasures in different areas of the software development lifecycle. The hands on labs will enable the student to get a firsthand experience of the Hackers world and what could be done to stop him. Using sound programming techniques and best practices shown in this course, you will be able to produce high-quality code that stands up to attack.

The course covers major security principles in the Java framework, programming vulnerabilities, and specific security issues in J2EE web applications.

Target audience

Members of the software development team:

- Java developers in J2EE based applications
- Designers & architects.

Prerequisites

Before attending this course, students should be familiar with:

- Basic knowledge of the Java framework
- Apache/Tomcat, Databases (MySQL/Oracle) & SQL language

Course topics

Day 1:

Authentication

- What is authentication
- Store password securely
- Hashing
- Brute force
- Dictionary attack
- Anti automation
- CAPTCHA
- Account lockout
- User enumeration
- Basic & Digest authentication
- Windows integration
- Form based authentication
- LAB**

Authorization

- Client side authorization
- Forceful browsing
- UI based security
- Parameter tampering
- Insecure direct object reference
- File authorization
- URL authorization
- ACL (Access Control List)
- RBAC (Role based ACL)
- LAB**

Input Validation

- OS command injection
- SQL Injection
- Prepared statement
- Store procedure
- Xpath injection
- LDAP injection
- Data type conversion
- Black list
- White list

- ☐ Regular expression
- ☐ **LAB**

Day 2:

Output Encoding

- ☐ Reflected / Stored Cross site scripting
- ☐ XSS threats
- ☐ Encoding types
- ☐ ESAPI library
- ☐ XSS prevention cheat sheet
- ☐ **LAB**

Browser Manipulation

- ☐ Cross Site Request Forgery (CSRF)
- ☐ Anti CSRF token
- ☐ Open redirect
- ☐ Clickjacking
- ☐ Auto complete
- ☐ Browser's cache
- ☐ Session management
- ☐ Cookie's properties
- ☐ Session fixation
- ☐ **LAB**

File Handling

- ☐ Directory traversal
- ☐ Canonicalization
- ☐ File extension handling
- ☐ Filenames threats
- ☐ Directory listing
- ☐ **LAB**

Day 3:

Data Confidentiality & Integrity

- Homemade algorithm
- Insecure communication
- Secure traffic enforcement
- Insecure storage
- Symmetric encryption
- A-Symmetric encryption
- Java Cryptography Architecture (JCA)
- Hash functions
- Digital signatures
- LAB**

Error Handling

- Information disclosure
- Exceptions and stack trace
- Default error pages
- LAB**

Security Logging

- Logging technologies
- Events you should log
- Events you should not log
- LAB**

Business Logic

- Logical attacks
- Flow bypassing
- Replay attacks
- Abuse of functionality
- LAB**
